Reviving a Mature, Watered-Out Fractured Carbonate Reservoir: An Integrated Approach to Designing a Miscible EOR Scheme for the Bigoray Field in Alberta

William Sawchuk
VP Operations, Pulse Oil Corp

Schlumberger

Bigoray Area of the Pembina Field

2 of about 50 naturally-fractured Devonian reefs in the Nisku formation in Alberta, Canada

Production started in 1978

Waterflooding started in 1979

Pools shut-in in 2014 due to high water cuts.
Targeted for EOR and acquired by Pulse Oil in 2017.

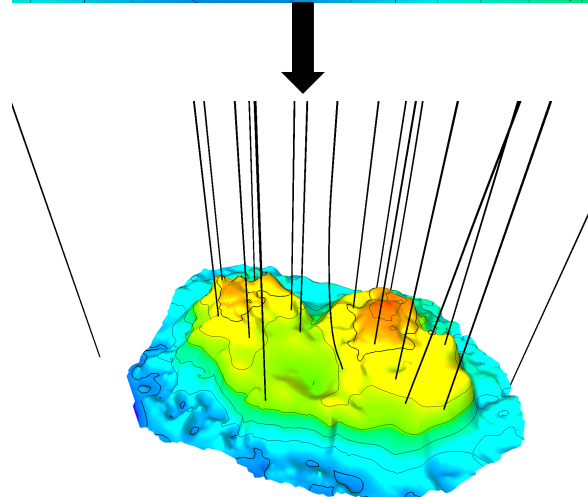

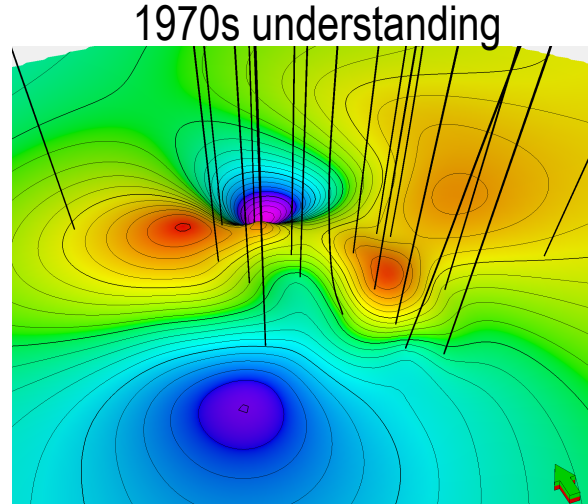

Project Phases

- Phase I – Reservoir Characterization: Petrophysical and Geological Study
- Phase II – Geomodelling: Static reservoir model (reservoir geometry/properties)
- Phase III – Numerical Reservoir Simulation

Multidisciplinary Integrated Approach

The outcome of each discipline affects the input of the other disciplines

2019 characterization 

Technology

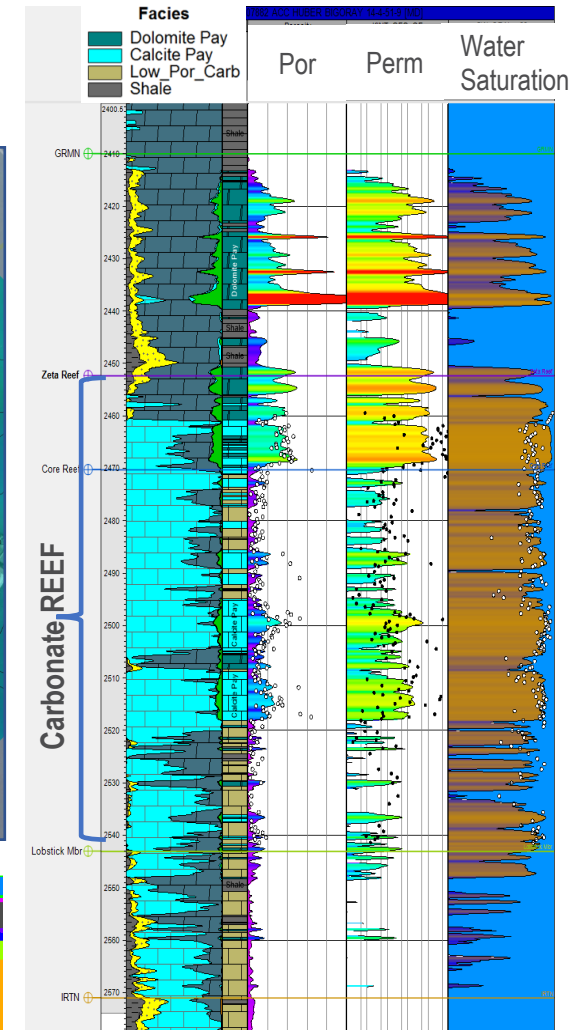

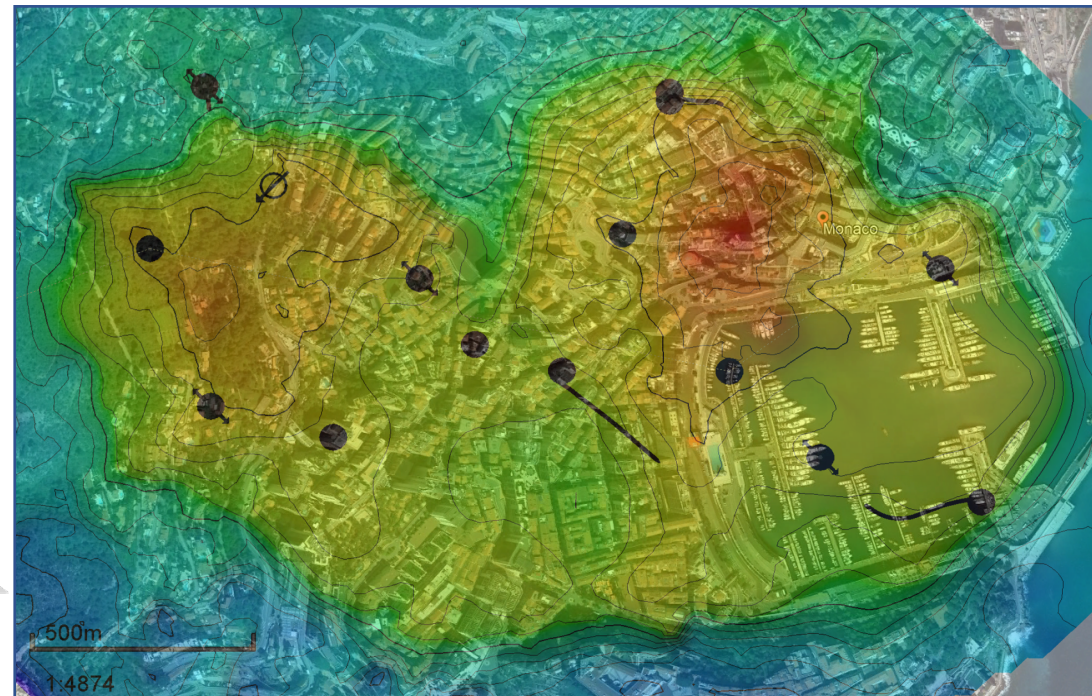

Domain Expertise

Petrophysical Analysis

ELAN analysis provided a discrete facies distribution and characterization

Petrophysical model consistent with core analysis and poro/perm measurements

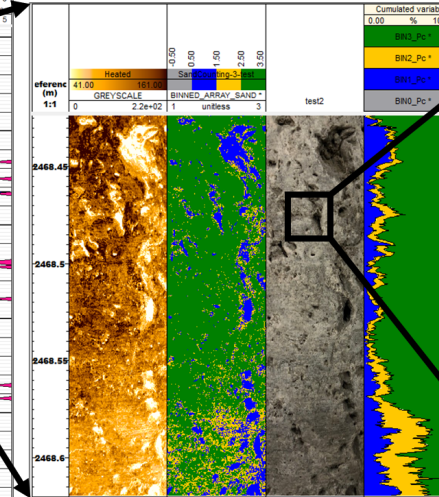

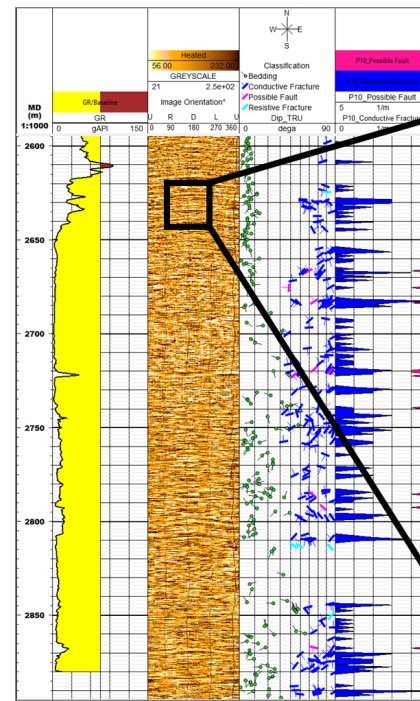

Geological Analysis

Complex triple porosity system: matrix, fractures and vugs

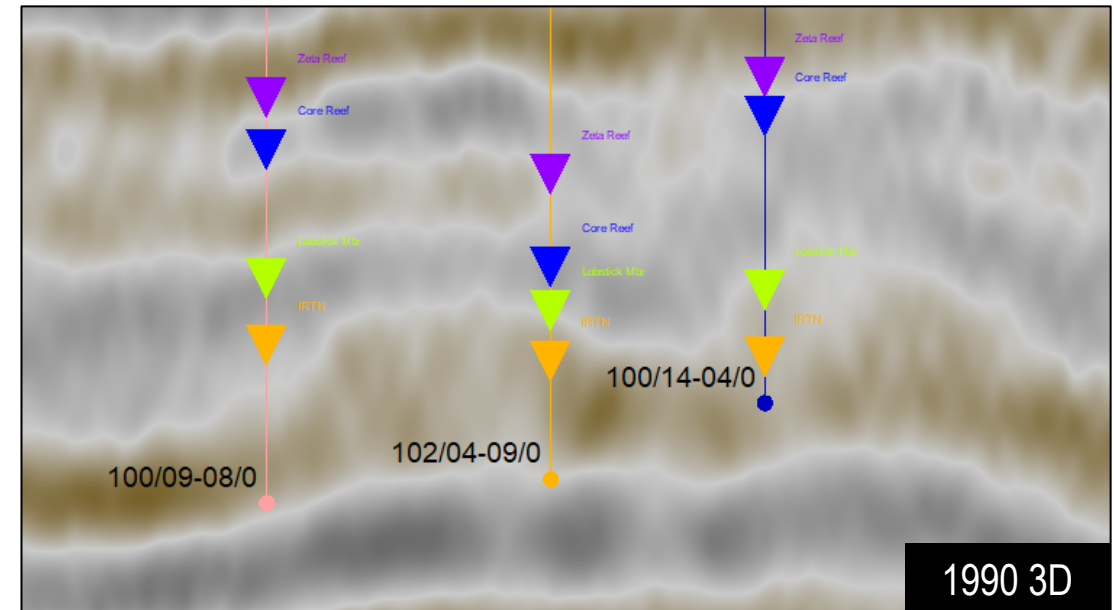

Core evaluation correlated to spectral analysis

Image logs used to obtain fracture intensity/spacing and orientation

Seismic Analysis

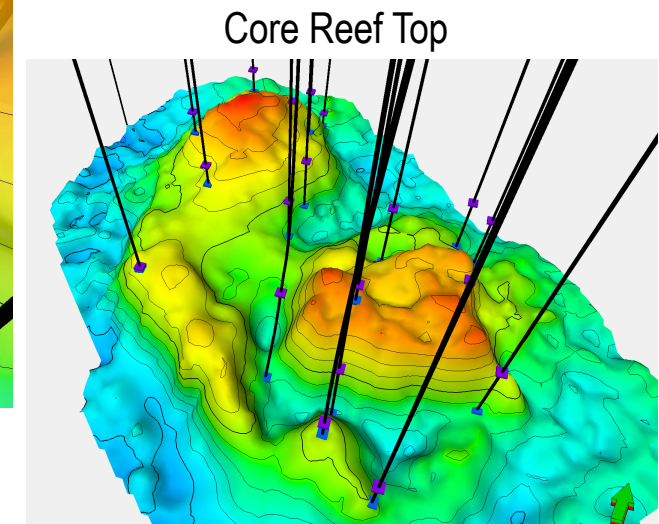

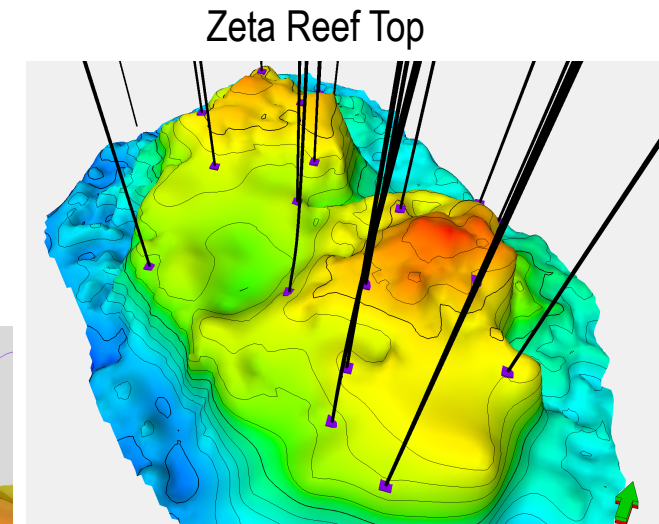

3D seismic program was reinterpreted and combined with petrophysics derived well tops to obtain an updated geometry of the reefs

Seismic Analysis

Ant tracking seismic attributes improved the definition of internal structure

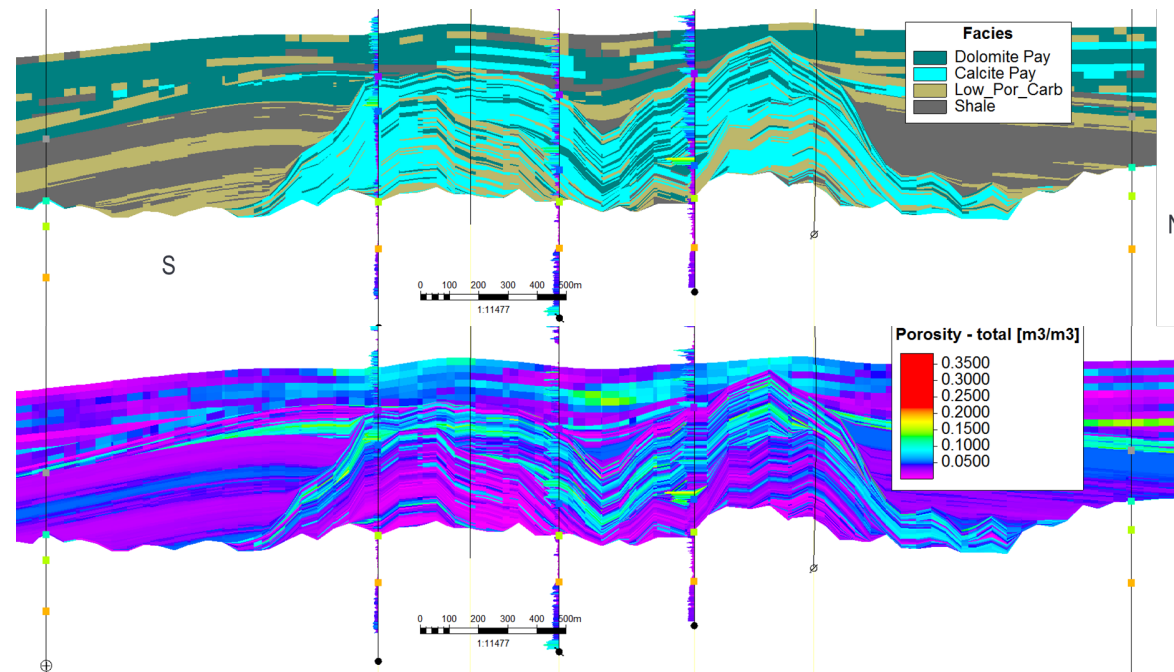

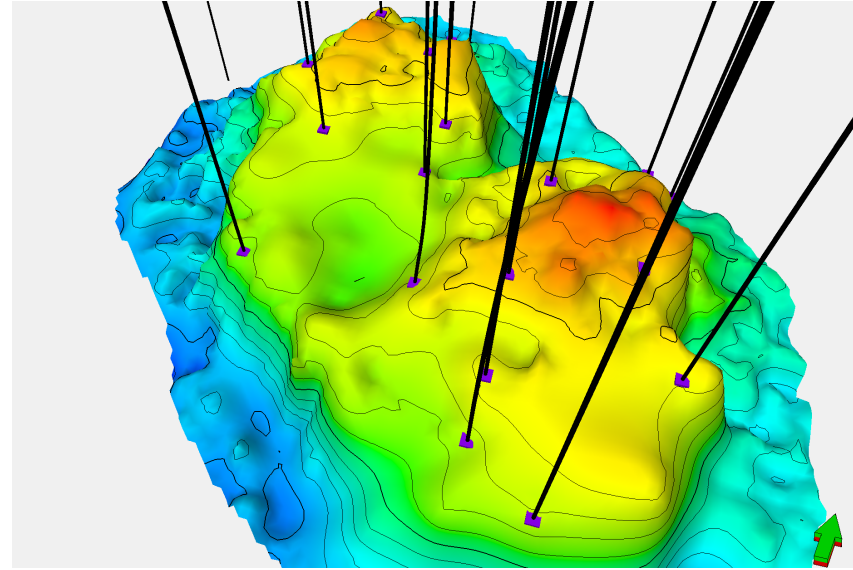

Fracture intensity from image logs was correlated with an ant tracking seismic attribute and was propagated into a discrete fracture network (DFN)

Geomodelling

Seismic-driven structure

Geostatistically-distributed properties

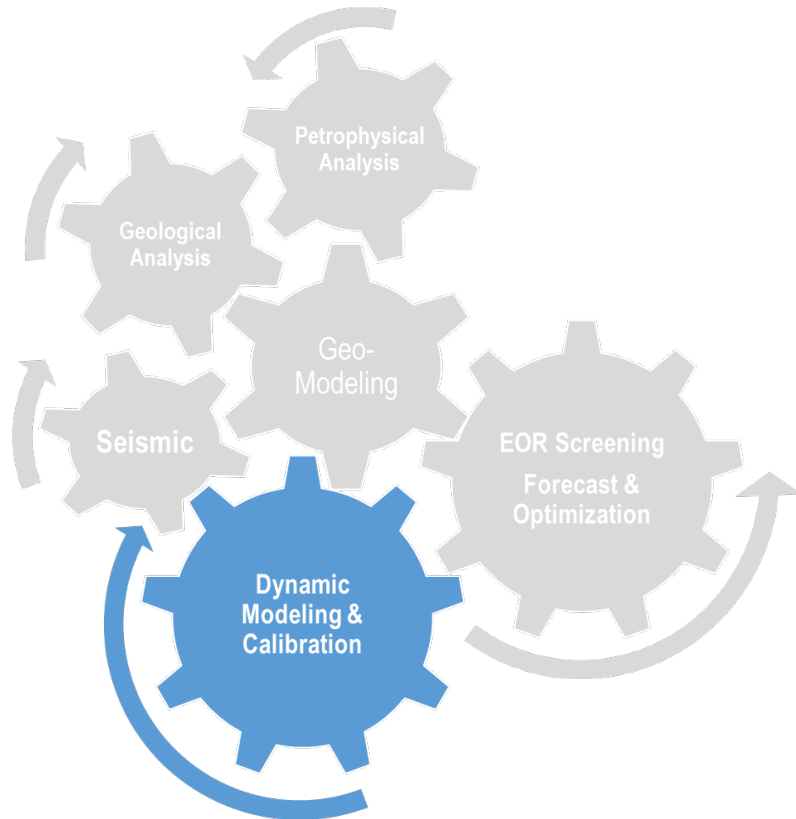

Dynamic Modelling / History-matching

A dual-porosity/dual-permeability **DP/DP** model

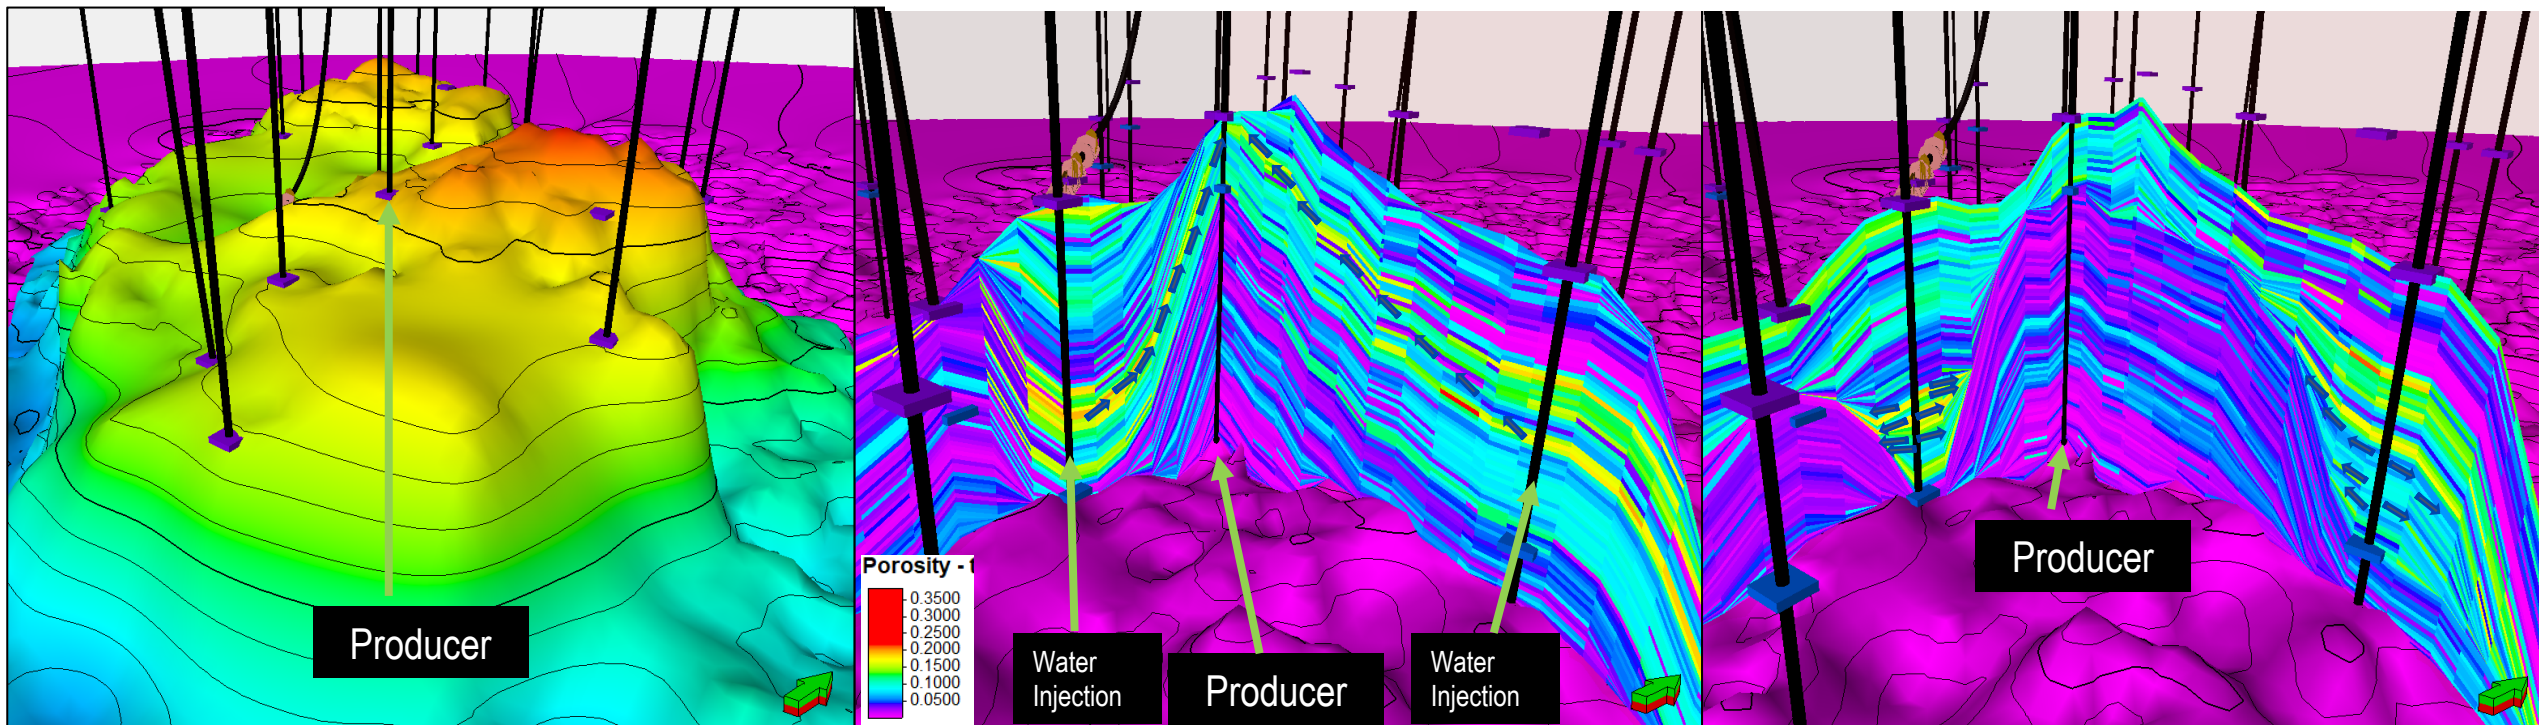

Model reproduces 40 years of production/water injection

Oil, water and gas rates as well as pressures and breakthrough times are matched to historical observations

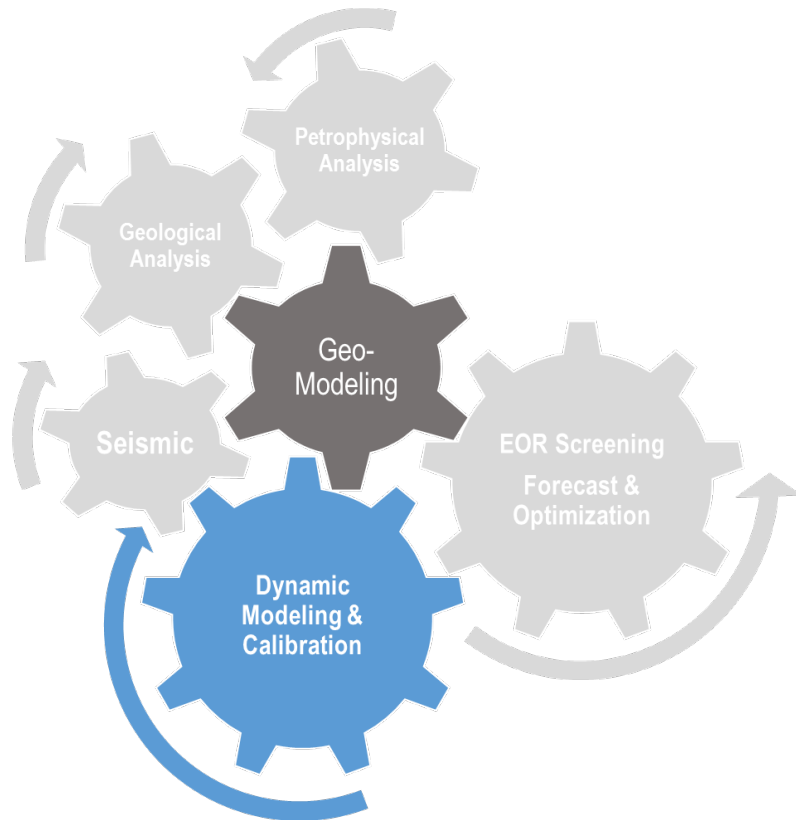

History-matching

Static model was iteratively updated until the appropriate reservoir connectivity was established to honor historical production/injection

History-matching

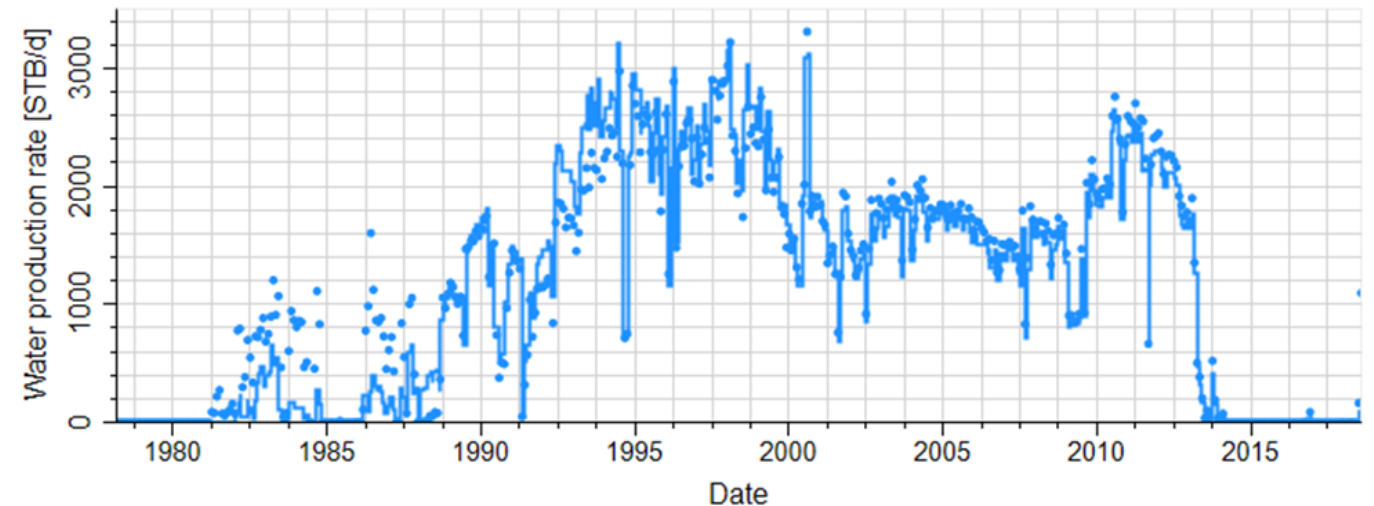

Final field-wide match

Field, Oil production rate

Field, Water production rate

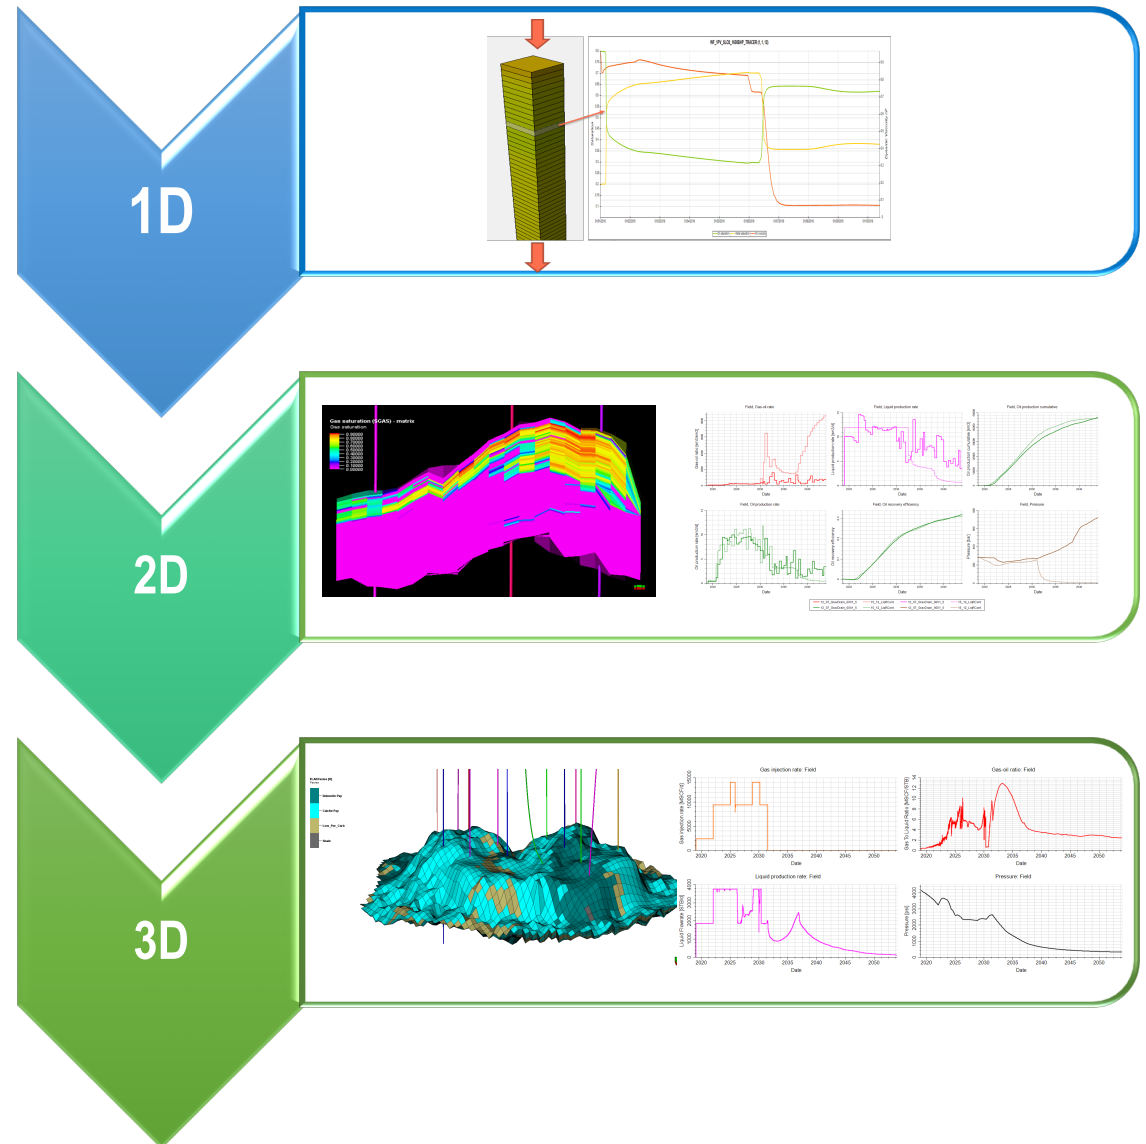

Forecasting Optimization

1D solvent injection runs

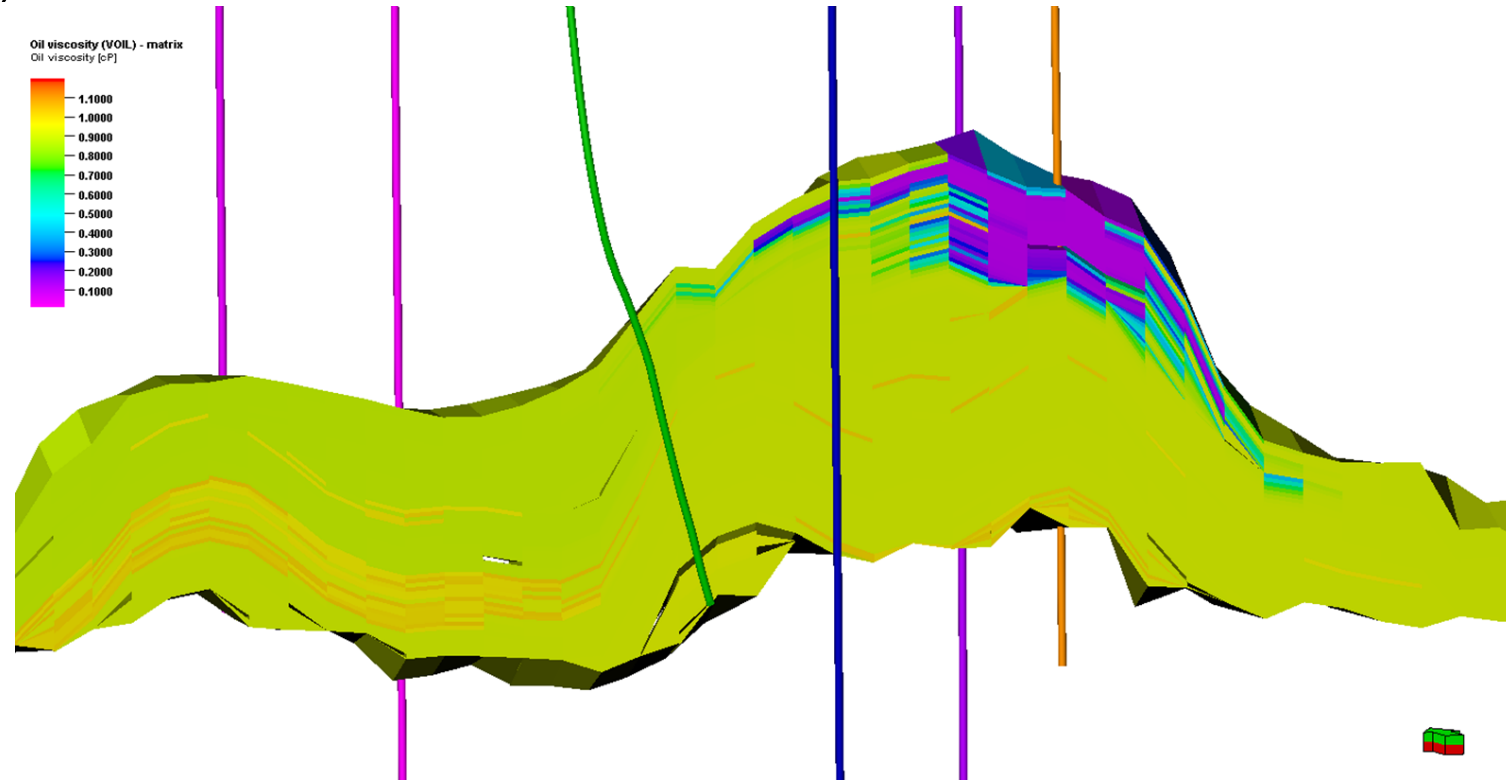

2D solvent/chase gas runs

Optimize solvent scheduling, production and injection rates and controls

Solvent Injection Forecasting

Oil viscosity – liquid solvent injection (2021)

Solvent Injection Forecasting

Gas saturation – chase gas injection (2029)

Solvent Injection Forecasting

Gas saturation – blowdown period (2032)

Solvent Injection Forecasting

Gas saturation – blowdown period (2035)

Solvent Injection Forecasting

Gas saturation – blowdown period (2038)

Solvent Injection Forecasting

Gas saturation – blowdown period (2042)

Solvent Injection Forecasting

Optimized field-wide predicted incremental oil recovery
